Data Import : : **CHEAT SHEET**

R's **tidyverse** is built around **tidy data** stored in **tibbles**, which are enhanced data frames.

The front side of this sheet shows how to read text files into R with **readr**.

The reverse side shows how to create tibbles with **tibble** and to layout tidy data with **tidyr**.

OTHER TYPES OF DATA

Try one of the following packages to import other types of files

- **haven** - SPSS, Stata, and SAS files
- **readxl** - excel files (.xls and .xlsx)
- **DBI** - databases
- **jsonlite** - json
- **xml2** - XML
- **httr** - Web APIs
- **rvest** - HTML (Web Scraping)

Save Data

Save **x**, an R object, to **path**, a file path, as:

Comma delimited file
  write_csv(x, path, na = "NA", append = FALSE, col_names = !append**)**

File with arbitrary delimiter
  write_delim(x, path, delim = " ", na = "NA", append = FALSE, col_names = !append**)**

CSV for excel
  write_excel_csv(x, path, na = "NA", append = FALSE, col_names = !append**)**

String to file
  write_file(x, path, append = FALSE**)**

String vector to file, one element per line
  write_lines(x,path, na = "NA", append = FALSE**)**

Object to RDS file
  write_rds(x, path, compress = c("none", "gz", "bz2", "xz"), ...**)**

Tab delimited files
  write_tsv(x, path, na = "NA", append = FALSE, col_names = !append**)**

Read Tabular Data - These functions share the common arguments:

read_*(file, col_names = TRUE, col_types = NULL, locale = default_locale(), na = c("", "NA"),
  quoted_na = TRUE, comment = "", trim_ws = TRUE, skip = 0, n_max = Inf, guess_max = min(1000,
  n_max), progress = interactive())

Comma Delimited Files
  read_csv("file.csv"**)**
    To make file.csv run:
    write_file(x = "a,b,c\n1,2,3\n4,5,NA", path = "file.csv")

Semi-colon Delimited Files
  read_csv2("file2.csv"**)**
    write_file(x = "a;b;c\n1;2;3\n4;5;NA", path = "file2.csv")

Files with Any Delimiter
  read_delim("file.txt", delim = "|"**)**
    write_file(x = "a|b|c\n1|2|3\n4|5|NA", path = "file.txt")

Fixed Width Files
  read_fwf("file.fwf", col_positions = c(1, 3, 5)**)**
    write_file(x = "a b c\n1 2 3\n4 5 NA", path = "file.fwf")

Tab Delimited Files
  read_tsv("file.tsv"**) Also read_table().**
    write_file(x = "a\tb\tc\n1\t2\t3\n4\t5\tNA", path = "file.tsv")

USEFUL ARGUMENTS

Example file
write_file("a,b,c\n1,2,3\n4,5,NA","file.csv")
f <- "file.csv"

No header
read_csv(f, **col_names = FALSE**)

Provide header
read_csv(f, **col_names = c("x", "y", "z")**)

Skip lines
read_csv(f, **skip = 1**)

Read in a subset
read_csv(f, **n_max = 1**)

Missing Values
read_csv(f, **na = c("1", ".")**)

Read Non-Tabular Data

Read a file into a single string
  read_file(file, locale = default_locale()**)**

Read each line into its own string
  read_lines(file, skip = 0, n_max = -1L, na = character(), locale = default_locale(), progress = interactive()**)**

Read Apache style log files
  read_log(file, col_names = FALSE, col_types = NULL, skip = 0, n_max = -1, progress = interactive()**)**

Read a file into a raw vector
  read_file_raw(file**)**

Read each line into a raw vector
  read_lines_raw(file, skip = 0, n_max = -1L, progress = interactive()**)**

Data types

readr functions guess the types of each column and convert types when appropriate (but will NOT convert strings to factors automatically).

A message shows the type of each column in the result.

```
## Parsed with column specification:
## cols(
##   age = col_integer(),
##   sex = col_character(),
##   earn = col_double()
## )
```
age is an integer
sex is a character
earn is a double (numeric)

1. Use **problems()** to diagnose problems.
  x <- read_csv("file.csv"); problems(x)

2. Use a col_ function to guide parsing.
- **col_guess()** - the default
- **col_character()**
- **col_double(), col_euro_double()**
- **col_datetime(**format = ""**)** Also
  col_date(format = ""**), col_time(**format = ""**)**
- **col_factor(**levels, ordered = FALSE**)**
- **col_integer()**
- **col_logical()**
- **col_number(), col_numeric()**
- **col_skip()**

x <- read_csv("file.csv", col_types = cols(
  A = col_double(),
  B = col_logical(),
  C = col_factor()))

3. Else, read in as character vectors then parse with a parse_ function.
- **parse_guess()**
- **parse_character()**
- **parse_datetime()** Also **parse_date()** and **parse_time()**
- **parse_double()**
- **parse_factor()**
- **parse_integer()**
- **parse_logical()**
- **parse_number()**

x$A <- parse_number(x$A)

Tibbles - an enhanced data frame

The **tibble** package provides a new S3 class for storing tabular data, the tibble. Tibbles inherit the data frame class, but improve three behaviors:

- **Subsetting** - [always returns a new tibble, [[and $ always return a vector.

- **No partial matching** - You must use full column names when subsetting

- **Display** - When you print a tibble, R provides a concise view of the data that fits on one screen
```
# A tibble: 234 × 6
   manufacturer      model displ
          <chr>      <chr> <dbl>
1          audi         a4   1.8
2          audi         a4   1.8
3          audi         a4   2.0
4          audi         a4   2.0
5          audi         a4   2.8
6          audi         a4   2.8
7          audi         a4   3.1
8          audi a4 quattro   1.8
9          audi a4 quattro   1.8
10         audi a4 quattro   2.0
# ... with 224 more rows, and 3
#   more variables: year <int>,
#   cyl <int>, trans <chr>
```

tibble display

```
156 1999   6    auto(l4)
157 1999   6    auto(l4)
158 2008   6    auto(l4)
159 2008   6    auto(s4)
160 2008   8  manual(m5)
161 1999   4    auto(l4)
162 2008   4 manual(m5)
163 2008   4 manual(m5)
164 2008   4    auto(l4)
165 2008   4    auto(l4)
166 1999   4    auto(l4)
[ reached getOption("max.print")
-- omitted 68 rows ]
```

A large table to display → **data frame display**

- Control the default appearance with options:
  options(tibble.print_max = n, tibble.print_min = m, tibble.width = Inf**)**

- View full data set with **View()** or **glimpse()**

- Revert to data frame with **as.data.frame()**

CONSTRUCT A TIBBLE IN TWO WAYS

tibble(…**)**
Construct by columns.
tibble(x = 1:3, y = c("a", "b", "c"))

Both make this tibble

tribble(…**)**
Construct by rows.
tribble(~x,   ~y,
*   1, "a",*
*   2, "b",*
*   3, "c")*

```
A tibble: 3 × 2
      x     y
  <int> <chr>
1     1     a
2     2     b
3     3     c
```

**as_tibble(**x, …**)** Convert data frame to tibble.

**enframe(**x, name = "name", value = "value"**)**
Convert named vector to a tibble

**is_tibble(**x**)** Test whether x is a tibble.

# Tidy Data with tidyr

**Tidy data** is a way to organize tabular data. It provides a consistent data structure across packages.
A table is tidy if:

Each **variable** is in its own **column**

&

Each **observation**, or **case**, is in its own **row**

Tidy data:

Makes variables easy to access as vectors

A * B –> C

Preserves cases during vectorized operations

## Reshape Data - change the layout of values in a table

Use **gather()** and **spread()** to reorganize the values of a table into a new layout.

**gather(**data, key, value, …, na.rm = FALSE, convert = FALSE, factor_key = FALSE**)**

gather() moves column names into a **key** column, gathering the column values into a single **value** column.

table4a

| country | 1999 | 2000 |
|---------|------|------|
| A | 0.7K | 2K |
| B | 37K | 80K |
| C | 212K | 213K |

→

| country | year | cases |
|---------|------|-------|
| A | 1999 | 0.7K |
| B | 1999 | 37K |
| C | 1999 | 212K |
| A | 2000 | 2K |
| B | 2000 | 80K |
| C | 2000 | 213K |

key  value

*gather(table4a, `1999`, `2000`,*
*key = "year", value = "cases")*

**spread(**data, key, value, fill = NA, convert = FALSE, drop = TRUE, sep = NULL**)**

spread() moves the unique values of a **key** column into the column names, spreading the values of a **value** column across the new columns.

table2

| country | year | type | count |
|---------|------|------|-------|
| A | 1999 | cases | 0.7K |
| A | 1999 | pop | 19M |
| A | 2000 | cases | 2K |
| A | 2000 | pop | 20M |
| B | 1999 | cases | 37K |
| B | 1999 | pop | 172M |
| B | 2000 | cases | 80K |
| B | 2000 | pop | 174M |
| C | 1999 | cases | 212K |
| C | 1999 | pop | 1T |
| C | 2000 | cases | 213K |
| C | 2000 | pop | 1T |

key  value

| country | year | cases | pop |
|---------|------|-------|-----|
| A | 1999 | 0.7K | 19M |
| A | 2000 | 2K | 20M |
| B | 1999 | 37K | 172M |
| B | 2000 | 80K | 174M |
| C | 1999 | 212K | 1T |
| C | 2000 | 213K | 1T |

*spread(table2, type, count)*

# Handle Missing Values

**drop_na(**data, …**)**

Drop rows containing NA's in … columns.

x

| x1 | x2 |
|----|----|
| A | 1 |
| B | NA |
| C | NA |
| D | 3 |
| E | NA |

→

| x1 | x2 |
|----|----|
| A | 1 |
| D | 3 |

*drop_na(x, x2)*

**fill(**data, …, .direction = c("down", "up")**)**

Fill in NA's in … columns with most recent non-NA values.

x

| x1 | x2 |
|----|----|
| A | 1 |
| B | NA |
| C | NA |
| D | 3 |
| E | NA |

→

| x1 | x2 |
|----|----|
| A | 1 |
| B | 1 |
| C | 1 |
| D | 3 |
| E | 3 |

*fill(x, x2)*

**replace_na(**data, replace = list(), …**)**

Replace NA's by column.

x

| x1 | x2 |
|----|----|
| A | 1 |
| B | NA |
| C | NA |
| D | 3 |
| E | NA |

→

| x1 | x2 |
|----|----|
| A | 1 |
| B | 2 |
| C | 2 |
| D | 3 |
| E | 2 |

*replace_na(x, list(x2 = 2))*

# Expand Tables - quickly create tables with combinations of values

**complete(**data, …, fill = list()**)**

Adds to the data missing combinations of the values of the variables listed in …
*complete(mtcars, cyl, gear, carb)*

**expand(**data, …**)**

Create new tibble with all possible combinations of the values of the variables listed in …
*expand(mtcars, cyl, gear, carb)*

# Split Cells

Use these functions to split or combine cells into individual, isolated values.

**separate(**data, col, into, sep = "[^[:alnum:]]+", remove = TRUE, convert = FALSE, extra = "warn", fill = "warn", …**)**

Separate each cell in a column to make several columns.

table3

| country | year | rate |
|---------|------|------|
| A | 1999 | 0.7K/19M |
| A | 2000 | 2K/20M |
| B | 1999 | 37K/172M |
| B | 2000 | 80K/174M |
| C | 1999 | 212K/1T |
| C | 2000 | 213K/1T |

→

| country | year | cases | pop |
|---------|------|-------|-----|
| A | 1999 | 0.7K | 19M |
| A | 2000 | 2K | 20M |
| B | 1999 | 37K | 172 |
| B | 2000 | 80K | 174 |
| C | 1999 | 212K | 1T |
| C | 2000 | 213K | 1T |

*separate(table3, rate,*
*into = c("cases", "pop"))*

**separate_rows(**data, …, sep = "[^[:alnum:].]+", convert = FALSE**)**

Separate each cell in a column to make several rows. Also **separate_rows_()**.

table3

| country | year | rate |
|---------|------|------|
| A | 1999 | 0.7K/19M |
| A | 2000 | 2K/20M |
| B | 1999 | 37K/172M |
| B | 2000 | 80K/174M |
| C | 1999 | 212K/1T |
| C | 2000 | 213K/1T |

→

| country | year | rate |
|---------|------|------|
| A | 1999 | 0.7K |
| A | 1999 | 19M |
| A | 2000 | 2K |
| A | 2000 | 20M |
| B | 1999 | 37K |
| B | 1999 | 172M |
| B | 2000 | 80K |
| B | 2000 | 174M |
| C | 1999 | 212K |
| C | 1999 | 1T |
| C | 2000 | 213K |
| C | 2000 | 1T |

*separate_rows(table3, rate)*

**unite(**data, col, …, sep = "_", remove = TRUE**)**

Collapse cells across several columns to make a single column.

table5

| country | century | year |
|---------|---------|------|
| Afghan | 19 | 99 |
| Afghan | 20 | 0 |
| Brazil | 19 | 99 |
| Brazil | 20 | 0 |
| China | 19 | 99 |
| China | 20 | 0 |

→

| country | year |
|---------|------|
| Afghan | 1999 |
| Afghan | 2000 |
| Brazil | 1999 |
| Brazil | 2000 |
| China | 1999 |
| China | 2000 |

*unite(table5, century, year,*
*col = "year", sep = "")*
